Question 1. [5 marks]

Consider the following problem. Answer it appropriately.

The Petersens have recently moved to a new town and are arranging a surprise birthday party for their son Andre, and have invited <u>three families</u> from the neighbourhood, th<u>e Smiths</u>, the <u>Januarys</u> and th<u>e Hectors</u>. They plan to make up party packets for the kids to take home after the party, <u>blue for boys</u> and <u>pink for girls</u>.

Being super organised, Mrs Petersen with the help of Mr Petersen wants to determine how many of each colour party packet she needs to buy, and also how many of each colour she needs to put aside for each family.

They sit down and come up with the following information. Mrs Petersen remembers that the Hectors have a "pigeon pair", i.e. a boy and a girl, Mr Petersen recalls that the Januarys only have a set of identical twin boys. Mrs Petersen notes that she's only ever noticed two girls from these local families to come over to play. Mr Petersen notes that the Smiths have three children, since the family fits nicely into their family sedan when they go out.

You happen to be visiting the Petersens at this point, and want to impress them with the problem solving skills you've learnt at university. Using the information they've provided, determine how many of each colour party packet they need to buy and how many of each colour they need to allocate to each family and what the total number of party packets are.

Use a diagram to show how you solve the problem.

Smiths Herous	<u></u>		1	y b blue party party
January	2		,	tal packets = 7
families	No. of boys	No. of ging	No. of	Dackets for each family
Smiths	3	0	3 party	packots & All Blue
Hectors	1		2 party	packets & lower 1 1-
January	2	0	Z par-	ty premots 1 A bk
	6		Total	porty pockets = 7
hospfre the	Smiths Show	ud receive 3-	blue porti	y parkers. Hectors

2

Question 2. [7 marks]

Answer the following questions:

a) When using debugging features in an IDE, what should the user typically do once execution has reached the breakpoint?	
Step Over the program process	
	[2]
b) When a new module has been defined, how do you ensure that it is accessible and ca imported into a program with no problems, i.e. "import newmodule" works?	ın be
It should be sayed in the same directory as the program, then it can be imported	[1]
c) Explain what happens in memory when Python makes successive recursive function	calls.
your fine spark	
run fine spark	[1]
Indicate whether the following statements are True or False.	
d) The accepted Python coding convention for module names is long descriptive names uppercase.	s in
false	[1]
e) Curly brackets {} are used to enclose parameters to a function.	
false	[1]
f) The print() function can be used to write to a file.	
_ Irue	[1]

Question 3. [6 marks]

Write a Python function called draw_line() which draws a horizontal line of characters. The draw_line() function should take two parameters, with the first being the size of the line (i.e. the number of characters) and the second parameter being the character with which to draw the line. This character parameter should have a default value of an asterisk ('*').

Calling the draw_line() function with the following parameters should produce the corresponding output:

Question 4. [7 marks]

Consider the following recursive function definition:

```
def do_this(stuff):
    if len(stuff) == 0:
        return ""
    else:
        return str(stuff[0] * 2) + do_this(stuff[1:])
```

a) What datatype can the parameter to this function be?

b) What is the base case for this function?

$$|en(Stuff) = = 0$$

ii. print (do_this("123")) 273 Question 5. [4 marks] Consider the following Python program and answer the questions below: def main(): f = open('to_do_list.txt','a') while True: thing_to_do = input('Enter thing to do:') if thing_to_do == 'done': break else: f.write(thing_to_do + '\n') f.close() main() a) What is the name of the file created? to_do_list b) What mode is the file created in? append c) Looking at the code, how does the user terminate the program?			
Question 5. [4 marks] Consider the following Python program and answer the questions below: def main(): f = open('to_do_list.txt','a') while True: thing_to_do = input('Enter thing to do:') if thing_to_do == 'done': break else: f.write(thing_to_do + '\n') f.close() main() a) What is the name of the file created? to_do_list.txt','a') while True: thing_to_do == 'done': break else: f.write(thing_to_do + '\n') f.close() to_do_list.txt','a') while True: thing_to_do == 'done': break else: f.write(thing_to_do + '\n') to_lose() Do Looking at the code, how does the user terminate the program?	ii.print(do_thi	is("123"))	
Consider the following Python program and answer the questions below: def main(): f = open('to_do_list.txt','a') while True: thing_to_do = input('Enter thing to do:') if thing_to_do == 'done': break else: f.write(thing_to_do + '\n') f.close() main() a) What is the name of the file created? b) What mode is the file created in? C) Looking at the code, how does the user terminate the program?	_223	-	
Consider the following Python program and answer the questions below: def main(): f = open('to_do_list.txt','a') while True: thing_to_do = input('Enter thing to do:') if thing_to_do == 'done': break else: f.write(thing_to_do + '\n') f.close() main() a) What is the name of the file created? b) What mode is the file created in? C) Looking at the code, how does the user terminate the program?	Duestion 5. [4]	marksl	
f = open('to_do_list.txt', 'a') while True: thing_to_do = input('Enter thing to do:') if thing_to_do == 'done': break else: f.write(thing_to_do + '\n') f.close() main() a) What is the name of the file created? b) What mode is the file created in? c) Looking at the code, how does the user terminate the program?	•	•	
what is the name of the file created? to _ do _ list b) What mode is the file created in? append c) Looking at the code, how does the user terminate the program?	while True: thing_to_do if thing_to else: f.write	o = input('Enter thing to do:') o_do == 'done': break	
to - do - list b) What mode is the file created in? Experied c) Looking at the code, how does the user terminate the program?	nain()		
What mode is the file created in? Copper d Cooking at the code, how does the user terminate the program?	i) What is the name of the	file created?	
c) Looking at the code, how does the user terminate the program?	to-do-list	-	
c) Looking at the code, how does the user terminate the program?	b) What mode is the file cre	eated in?	
	append		
But made	c) Looking at the code, how	v does the user terminate the program?	
Ontoring done	Ontoring "	done!	
d) How will the information that the user enters be written in the file?			

Question 6. [6 marks]

Consider the following definition of the *classify_weight()* function. Specify test cases which thoroughly test the function, using equivalence classes and boundary value. For each test case specify whether it is an equivalence class value or a boundary value.

```
# classifies weight in kgs
def classify_weight(w):
    if 0 < w <= 60:
        return "light"
    elif 60 < w <= 120:
        return "heavy"
    else:
        return "error"</pre>
```

Values from are between and bo, e.g. 40

(10 quivalence class value)

The value 60; [boundary value]

Values from one between 60 and 120 e.g. 100

(0 quivalence class value)

The value 120; (boundary value)

James from are 1855 from 0, e.g. -1, [6]

(equivalence chass value/erropous value)

Values from are growner from 120; e.g. 1466

(equivalence chass value)
