Question 1. [5 marks]

Consider the following problem. Answer it appropriately.

The <u>Petersens</u> have recently moved to a new town and are arranging a surprise birthday party for their son <u>Andre</u>, and have invited three families from the neighbourhood, the <u>Smiths</u>, the <u>Januarys</u> and the <u>Hectors</u>. They plan to make up party packets for the kids to take home after the party, blue for boys and pink for girls.)

Being super organised, Mrs Petersen with the help of Mr Petersen wants to determine how many of each colour party packet she needs to buy, and also how many of each colour she needs to put aside for each family.

They sit down and come up with the following information. Mrs Petersen remembers that the Hectors have a "pigeon pair", i.e. a boy and a girl. Mr Petersen recalls that the Januarys only have a set of identical twin boys. Mrs Petersen notes that she's only ever noticed two girls from these local families to come over to play. Mr Petersen notes that the Smiths have three children, since the family fits nicely into their family sedan when they go out.

You happen to be visiting the Petersens at this point, and want to impress them with the problem solving skills you've learnt at university. Using the information they've provided, [determine how many of each colour party packet they need to buy] and [how many of each colour they need to allocate to each family and what the total number of party packets are.

Use a diagram to show how you solve the problem.

Boys # Carols #	
Smith's 12 V 1	for pink party packets
Januarys V2 X 0	they need two.
	for blue party packets
	the need 5
* for the smith they need two	
1 pink packet	
* for the Januarys they need only	two blue packets.
* for the Hectors they need one	blue purkel and
one pink packet.	,
* In total there a are 7	packets. [5]

Question 2. [7 marks]

Answer the following questions:

** a) When using debugging features in an IDE, what should the user typically do once execution has reached the breakpoint?					
The user should run the debugging tool so that it	(an_				
The user should run the debugging tool so that it trace the variables and the whole program.					
	[2]				
* b) When a new module has been defined, how do you ensure that it is accessible a imported into a program with no problems, i.e. "import newmodule" works?	nd can be				
By testing the module and using values.	[1]				
*c) Explain what happens in memory when Python makes successive recursive func The memory stores a charecter each time the funcis could and the memory can get full causing the state	etion calls. clion ark-ove[1] flow error				
Indicate whether the following statements are True or False. d) The accepted Python coding convention for module names is long descriptive nuppercase.	ames in				
e) Curly brackets {} are used to enclose parameters to a function.	[1]				
f) The print() function can be used to write to a file.					
True.	[1]				

Question 3. [6 marks]

Write a Python function called draw_line() which draws a horizontal line of characters. The draw_line() function should take two parameters, with the first being the size of the line (i.e. the number of characters) and the second parameter being the character with which to draw the line. This character parameter should have a default value of an asterisk ('*').

Calling the draw_line() function with the following parameters should produce the corresponding output:

```
def draw_line ($size, charector):

charector = "*"

line = charector * size

return line
```

[6]

[2]

Question 4. [7 marks]

Consider the following recursive function definition:

a) What datatype can the parameter to this function be?

,	J F	P continue	 on o o .	
	01 1			
	String.			
	J			

b) What is the base case for this function?

$$if len (stuff) = 0$$
[1]

c) Based on the do_this() function definition, what will the following statementsi. print(do_this([1,2,3]))	display?
data type error.	[2]
<pre>ii. print (do_this("123"))</pre>	
1123	[2]
Question 5. [4 marks]	
Consider the following Python program and answer the questions below:	
<pre>def main(): f = open('to_do_list.txt','a') while True: thing_to_do = input('Enter thing to do:') if thing_to_do == 'done': break else: f.write(thing_to_do + '\n') f.close()</pre>	
main()	
a) What is the name of the file created? to _do_ list	[1]
b) What mode is the file created in? text file	[1]
c) Looking at the code, how does the user terminate the program? When the user enters done"	[1]
d) How will the information that the user enters be written in the file? The statement f. write (thing_fo_do + '\n') ensures their the information enterend will be appended to the text file line by line.	[1]

Question 6. [6 marks]

Consider the following definition of the *classify_weight()* function. Specify test cases which thoroughly test the function, using equivalence classes and boundary value. For each test case specify whether it is an equivalence class value or a boundary value.

```
# classifies weight in kgs
   def classify_weight(w):
       if 0 < w <= 60:
           return "light"
       elif 60 < w <= 120:
           return "heavy"
       else:
           return "error"
                                  by entering
                        function
                           works. L'boundary value
                   lunction
                     num bers
            en ter
                             equivalence class value
